The ADSL menu and cable Internet are two types of broadband connections, which are usually what many small and medium-sized businesses consider when choosing a provider. When deciding what can meet your business needs, you need to consider availability, speed and reliability. For more tips on finding the right internet connection for your business, check out our post about things to consider when choosing a provider. The availability of ADSL connections is available mainly in urban areas where you can get a phone line, usually you can get ADSL. You have to be within 22,000 feet of the central office of the phone company (CO) in order to get this type of service.1 Accessibility for cable Internet is pretty straight forward: if you're in the countryside, you probably won't be able to get cable Internet, but in most cases when cable TV is available, so is the cable Internet. THE speed of ADSL download speeds range from 5 Mbps to 50 Mbps in some areas, with download speeds of up to 1.0 Mbps. Delays are slightly better with ADSL than with cable, depending on the location of your business.1 Cable can provide businesses speeds all the way from 10 Mbps to 100 Mbps down and 1 to 5 Mbps up. Bandwidth is shared with other users in the area, so that speed can slow down during high traffic, or peak times.1 The reliability of the ADSL connection is what is considered always to connect, meaning your device is always connected to the Internet as long as it is on and the phone lines remain active and intact.1 It is important to keep in mind that if your phone line is accidentally cut out of the service or your Internet will go down. If your business requires an internet that is very accessible, you may want to consider an additional connection for your business because it would be ideal to have a backup for Internet access. 2 Typical repair time is 24-48 hours depending on downtime. Cable Internet, like ADSL, always provides a connection: as long as your device and cable lines are active and in working order, you are connected to the Internet.1 Having a backup service for Internet access would be a good idea for a cable connection as well as for ADSL. That's because cable lines, like phone lines, can go down. Once this happens, your internet connection will go down as well.1 Again, the typical repair time is 24-48 hours depending on the downtime. The cost of monthly prices for ADSL services can range from \$20 to \$90, depending on the speed and duration of the contract. Since the phone service is usually a requirement, you can tolerate the extra cost for the phone line to be in working order.3 Be sure to ask if Stand Alone ADSL is available. Installation and installation fees apply as well. Cable connections are often bundled with phone and cable TV services, allowing a good price for cable Internet. The stand-alone option will cost more, most likely. Installation fees can also be applied with But overall, monthly fees can be somewhere between \$60 and \$300 per month.3 ADSL vs. ADSL fiber and fiber Internet connection are on two different playing fields. Each one offers many benefits, but when you break it down and look at availability, speed, reliability and cost, you can really start to understand where everyone will or won't take into account your business needs. For more tips on finding the right internet connection for your business, check out our post about things to consider when choosing a provider. The availability of ADSL connections is available mainly in urban areas where you can get a phone line, usually you can get ADSL. You have to be within 22,000 feet of the central office of the phone company (CO) in order to get this type of service, because as you move further away from CO, the signal weakens and the internet speed slows down significantly.1 Fiber-optic connection is available in limited areas, but this is changing rapidly due to demand for faster speeds. Since fiber uses a completely different cable structure, the ADSL, new cables are required for maintenance, so: it may be some time before it covers the same trail as ADSL provides. Speed, however, does not affect distance as is the case with ADSL.2 ADSL speed downloads vary from 5 Mbps to 50 Mbps in some areas, with download speeds of up to 1.0 Mbps. ADSL is an asymmetrical connection and cannot offer the same download and download speed. Delay with ADSL usually ranges from 75 to 400ms, depending on the location of your business.1 Speeds for fiber optic connections are nothing short of impressive, ranging from 5 Mbps and 100 Gbps to download and download! Fiber is usually a symmetrical compound, so you'll have the same download and download speed. With an Internet connection like this, several users can download and download, share files, and stream audio and video all at the same time with little or no impact on performance.2 Delays are usually not a problem with fibers either. The reliability of the ADSL connection is what is considered always to connect, meaning your device is always connected to the Internet as long as it is on and the phone lines remain active and intact.1 It is important to keep in mind that if your phone line is accidentally cut out by a service worker or taken out of service due to extreme weather conditions, your internet will go down. If your business requires an internet that is highly affordable you may want to consider an additional connection for your business because it would be ideal to have a backup option for internet access.2 Typical repair time is 24-48 hours depending on downtime. Of all the internet connections available, fiber is arguably the most reliable and the highest Even in the event of power outages, it is much less likely than ADSL to be affected. In addition, fiber optic lines use glass as a conductor and therefore do not experience interference from high-voltage electrical equipment or or Power lines, unlike ADSL, which generates electricity.2 Typical repair time is 2-12 hours depending on the outage. The cost of monthly prices for ADSL services can range from \$20 to \$90, depending on the speed you sign up for and the duration of your contract if it is there. Since a phone service is needed, you can tolerate the additional costs of the phone line to be in working order, and installation fees can apply as well.3 The cost of fiber optic is usually much higher than the cost of ADSL, ranging from \$100 to \$5,000 per month. These prices may vary depending on your location, desired speed and the terms of your service agreement. Installation fees and activation fees can occur, but are usually abandoned with promotional offers or signing 1-, 2-, or 3-year-old agreement.2 INTERNET TYPES: ADSL ADSL: ADSL stands for an asymmetrical digital subscription line and is a type of internet connection that uses pre-existing copper phone lines to transmit data. More words in our online dictionary! Standard DSL Installation Typical DSL Installation Here's an example of a typical DSL installation. To install, please follow these few steps: Connect the DSL filter splitter into the phone connector. Take the DSL modem and connect the phone cord to the ADSL/DSL port label Connect the other end of the phone's cord to the DSL connector on the DSL filter. Take the Ethernet cable and connect it to the Ethernet/WAN port on the modem Connect the other end to your computer power on the equipment installing the DSL Filters General Information Filter If you are experiencing static on the phone line while you are talking to someone on the phone and DSL service through Tranquility, then you probably need to install a DSL filter on the phone line. DSL filters come in all shapes and sizes, but they are all set roughly the same. Below you'll see an example of the filter and how to install it correctly. Filter Installation - Introduction / Adsl Basics There are various methods of connecting to the ADSL modeme, this page documents the connection through the network map for the ADSL connection using a dynamic IP address: - install the network card (which will be used to connect to the ADSL modeme) - installation/configuration of ADSL software - setting up ADSL Connection - make an Internet connection There may be some problems with the ADSL connection. Alternative access software for ADSL/ Cable modems for PPPoE : RASPPPOE (Win98/98SE/ME). - Install a network card (which will be used to connect to ADSL modem) - ADSL via network card: Win2k- Installation/ADL software configuration (win2000) - customize ADSL connection - make Internet connection Alternative Access Software for ADSL/ Cable for PPPoE : RASPPPOE (Win92000). - Identify ADSL Internet Connection - Set up ADSL Internet Connection - Connect via ADSL to the Internet Enjoy a quick build-up of web pages and very fast downloading large file files Not Microsoft Internet Connection Exchange for ADSL Important : Security ! With the ADSL line, which is usually offered at a fixed rate (24 hours/7 days a week), it is even more important to protect your system from unwanted Internet access: check security (through www.grc.com): and install a personal firewall. I like to publish some information about ADSL via USB modem, so I invite you to send me a few screen dumps of your network configuration (j_helmig@compuserve.com) (If I use your graphics on my pages, I'll give you a free download on the first received/first used/first download provided bases))
